100-tap Digital Potentiometer (POT)

CAT5113

Description

The CAT5113 is a single digital POT designed as an electronic replacement for mechanical potentiometers. Ideal for automated adjustments on high volume production lines, they are also well suited for applications where equipment requiring periodic adjustment is either difficult to access or located in a hazardous or remote environment.

The CAT5113 contains a 100-tap series resistor array connected between two terminals R_H and R_L . An up/down counter and decoder that are controlled by three input pins, determines which tap is connected to the wiper, R_W . The wiper setting, stored in nonvolatile memory, is not lost when the device is powered down and is automatically reinstated when power is returned. The wiper can be adjusted to test new system values without affecting the stored setting. Wiper-control of the CAT5113 is accomplished with three input control pins, \overline{CS} , U/ \overline{D} , and \overline{INC} . The \overline{INC} input increments the wiper in the direction which is determined by the logic state of the U/ \overline{D} input. The \overline{CS} input is used to select the device and also store the wiper position prior to power down.

The digital POT can be used as a three-terminal resistive divider or as a two-terminal variable resistor.

Features

- 100-position Linear Taper Potentiometer
- Non-volatile EEPROM Wiper Storage
- 10 nA Ultra-low Standby Current
- Single Supply Operation: 2.5 V 6.0 V
- Increment Up/Down Serial Interface
- Resistance Values: $1 \text{ k}\Omega$, $10 \text{ k}\Omega$, $50 \text{ k}\Omega$ and $100 \text{ k}\Omega$
- Available in PDIP, SOIC, TSSOP and MSOP Packages
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Automated Product Calibration
- Remote Control Adjustments
- Offset, Gain and Zero Control
- Tamper-proof Calibrations
- Contrast, Brightness and Volume Controls
- Motor Controls and Feedback Systems
- Programmable Analog Functions

PIN FUNCTION

Pin Name	Function	
INC	Increment Control	
U/D	Up/Down Control	
R _H	Potentiometer High Terminal	
GND	Ground	
R _W	Wiper Terminal	
RL	Potentiometer Low Terminal	
CS	Chip Select	
V _{CC}	Supply Voltage	

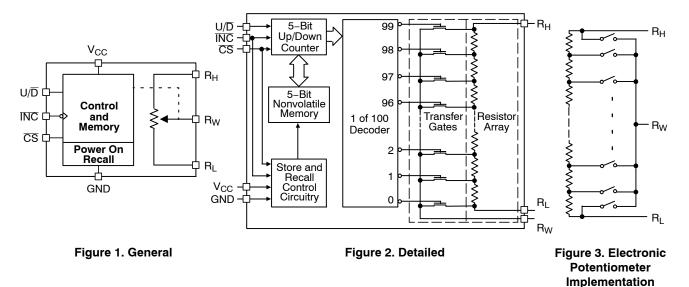

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

DEVICE MARKING INFORMATION

Functional Diagram

Pin Description

INC: Increment Control Input

The \overline{INC} input moves the wiper in the up or down direction determined by the condition of the U/ \overline{D} input.

U/D: Up/Down Control Input

The U/\overline{D} input controls the direction of the wiper movement. When in a high state and \overline{CS} is low, any high-to-low transition on \overline{INC} will cause the wiper to move one increment toward the R_H terminal. When in a low state and \overline{CS} is low, any high-to-low transition on \overline{INC} will cause the wiper to move one increment towards the R_L terminal.

R_H: High End Potentiometer Terminal

 R_H is the high end terminal of the potentiometer. It is not required that this terminal be connected to a potential greater than the R_L terminal. Voltage applied to the R_H terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

R_W: Wiper Potentiometer Terminal

 R_W is the wiper terminal of the potentiometer. Its position on the resistor array is controlled by the control inputs, \overline{INC} , U/\overline{D} and \overline{CS} . Voltage applied to the R_W terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

RL: Low End Potentiometer Terminal

 R_L is the low end terminal of the potentiometer. It is not required that this terminal be connected to a potential less than the R_H terminal. Voltage applied to the R_L terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND. R_L and R_H are electrically interchangeable.

CS: Chip Select

The chip select input is used to activate the control input of the CAT5113 and is active low. When in a high state, activity on the \overline{INC} and U/\overline{D} inputs will not affect or change the position of the wiper.

Device Operation

The CAT5113 operates like a digitally controlled potentiometer with R_H and R_L equivalent to the high and low terminals and R_W equivalent to the mechanical potentiometer's wiper. There are 100 available tap positions including the resistor end points, R_H and R_L . There are 99 resistor elements connected in series between the R_H and R_L terminals. The wiper terminal is connected to one of the 100 taps and controlled by three inputs, \overline{INC} , U/\overline{D} and \overline{CS} . These inputs control a seven-bit up/down counter whose output is decoded to select the wiper position. The selected wiper position can be stored in nonvolatile memory using the \overline{INC} and \overline{CS} inputs.

With \overline{CS} set LOW the CAT5113 is selected and will respond to the U/ \overline{D} and \overline{INC} inputs. HIGH to LOW transitions on \overline{INC} will increment or decrement the wiper (depending on the state of the U/ \overline{D} input and seven-bit counter). The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. The value of the counter is stored in nonvolatile memory whenever \overline{CS} transitions HIGH while the \overline{INC} input is also HIGH. When the CAT5113 is powered-down, the last stored wiper counter position is maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the counter is set to the value stored.

With $\overline{\text{INC}}$ set low, the CAT5113 may be de-selected and powered down without storing the current wiper position in nonvolatile memory. This allows the system to always power up to a preset value stored in nonvolatile memory.

Table 1. OPERATION MODES

INC	CS	U/D	Operation
High to Low	Low	High	Wiper toward H
High to Low	Low	Low	Wiper toward L
High	Low to High	х	Store Wiper Position
Low	Low to High	х	No Store, Return to Standby
X	High	Х	Standby

Table 2. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
Supply Voltage V _{CC} to GND	–0.5 to +7	V
Inputs CS to GND	–0.5 to V _{CC} +0.5	V
INC to GND	-0.5 to V _{CC} +0.5	V
U/D to GND	-0.5 to V _{CC} +0.5	V
H to GND	-0.5 to V _{CC} +0.5	V
L to GND	–0.5 to V _{CC} +0.5	V
W to GND	–0.5 to V _{CC} +0.5	V
Operating Ambient Temperature Commercial ('C' or Blank suffix)	0 to 70	°C
Industrial ('I' suffix)	-40 to +85	°C
Junction Temperature	+150	°C
Storage Temperature	–65 to 150	°C
Lead Soldering (10 s max)	+300	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 3. RELIABILITY CHARACTERISTICS

Symbol	Parameter	Test Method	Min	Тур	Мах	Units
V _{ZAP} (Note 1)	ESD Susceptibility	MIL-STD-883, Test Method 3015	2000			V
I _{LTH} (Notes 1, 2)	Latch-Up	JEDEC Standard 17	100			mA
T _{DR}	Data Retention	MIL-STD-883, Test Method 1008	100			Years
N _{END}	Endurance	MIL-STD-883, Test Method 1003	1,000,000			Stores

This parameter is tested initially and after a design or process change that affects the parameter.
 Latch-up protection is provided for stresses up to 100 mA on address and data pins from -1 V to V_{CC} + 1 V

Table 4. DC ELECTRICAL CHARACTERISTICS (V_{CC} = +2.5 V to +6 V unless otherwise specified)

Symbol	Parameter	Conditions	Min	Тур	Max	Units
POWER SUPPL	_Y	•				
V _{CC}	Operating Voltage Range		2.5	-	6.0	V
I _{CC1}	Supply Current (Increment)	V _{CC} = 6 V, f = 1 MHz, I _W = 0	-	-	100	μΑ
		V _{CC} = 6 V, f = 250 kHz, I _W = 0	-	-	50	μA
