

Si5386 Data Sheet

12-Channel, Any-Frequency, Any-Output wireless Jitter Attenuator / Clock Multiplier with Ultra-Low Noise

The Si5386 is an ultra high performance wireless jitter attenuator with any frequency outputs for eCPRI (ethernet-based Common Public Radio Interface) applications, which demand the highest level of integration and phase noise performance. Based on Silicon Laboratories' 4th generation DSPLL technology, the Si5386 combines frequency synthesis and jitter attenuation in a highly integrated digital solution with a cost-effective oscillator, and without the need of any external loop filter components. The fixed frequency oscillator provides frequency stability for free-run and holdover modes. This all-digital solution provides superior performance that is highly immune to external board disturbances such as power supply noise.

eCPRI-based remote radio heads and fixed wireless systems require a diverse set of clocks such as ADC/DAC, RF LOs, and Ethernet clocks. The Si5386 architecture is designed to deliver high-performance JESD204B DCLK and SYSREF clock pairs and flexible any-rate clocks for non-CPRI clocks such as Ethernet and system reference clocks all from a single IC.

Applications:

- Wireless Infrastructure
 - eCPRI RRH (Remote Radio Head)
 - BBU (Baseband Unit)
 - Small Cell and μ BTS
- DOCSIS
- Test and Measurement

KEY FEATURES

- Flexible timing in a single IC
 - Generates any combination of output frequencies from any input frequency
- Input frequency range:
 - Differential: 7.68 MHz to 750 MHz
 - LVCMS: 7.68 MHz to 250 MHz
- Output frequency range (Integer):
 - Differential: up to 2.94912 GHz
- Output frequency range (fractional):
 - Differential: up to 735 MHz
 - LVCMS: up to 250 MHz
- Ultra-low RMS jitter:
 - 72 fs typ (12 kHz–20 MHz)
- Phase noise of 122.88MHz carrier frequency:
 - 118 dBc/Hz @ 100Hz offset
- ITU-T G.8262 compliant

1. Features List

The Si5386 features are listed below:

- ITU-T G.8262 compliant
- Flexible timing in a single IC
 - Generates any combination of output frequencies from any input frequency
- Input frequency range:
 - Differential: 7.68 MHz to 750 MHz
 - LVC MOS: 7.68 MHz to 250 MHz
- Output frequency range (Integer):
 - Differential: up to 2.94912 GHz with JESD204B support
- Output frequency range (fractional):
 - Differential: up to 735 MHz
 - LVC MOS: up to 250 MHz
- Ultra-low RMS jitter (12kHz - 20MHz):
 - 72 fs typ at 122.88 MHz
 - 88 fs typ at 156.25 MHz
 - 79 fs typ at 322.265625 MHz
- Programmable jitter attenuation bandwidth from 1 Hz to 4 kHz
- Phase noise of 122.88 MHz carrier frequency:
 - -118 dBc/Hz @ 100 Hz offset
 - -133 dBc/Hz @ 1 kHz offset
 - -142 dBc/Hz @ 10 kHz offset
 - -149 dBc/Hz @ 100 kHz offset
 - -154 dBc/Hz @ 1 MHz offset
- Highly configurable outputs compatible with LVDS, LVPECL, LVC MOS, CML, and HCSL. CML outputs can be programmed to have 100-1600 mVpp single-ended swing.
- Status monitoring (LOS, OOF, LOL)
- Pin controlled input switching
- DSPLL with special wireless calibration
- Optional zero delay mode
- Hitless input clock switching: automatic or manual
- Automatic free-run and holdover modes
- Fastlock feature
- Glitchless on the fly output frequency changes
- Core voltage:
 - VDD: 1.8 V \pm 5%
 - VDDA: 3.3 V \pm 5%
- Independent output clock supply pins: 3.3 V, 2.5 V, or 1.8 V
- Output-output skew: 20 ps typ
- Serial interface: I2C or SPI
- In-circuit programmable with non-volatile OTP memory
- ClockBuilder ProTM software simplifies device configuration
- Temperature range: -40 to +85 °C
- Pb-free, RoHS-6 compliant

2. Ordering Guide

| Ordering Part Number (OPN) | Reference | Number of Input/Output Clocks | Output Clock Frequency Range (MHz) | Supported Frequency Synthesis Modes | Package | Temperature Range |
|------------------------------|-------------|-------------------------------|------------------------------------|-------------------------------------|---------------|-------------------|
| Si5386 | | | | | | |
| Si5386A-E-GM ^{1, 2} | External XO | 4/12 | 0.0001 to 2949.12 MHz | Integer and Fractional | 64-QFN 9x9 mm | -40 to 85 °C |

Notes:

1. Add an R at the end of the OPN to denote tape and reel ordering options.
2. Custom, factory preprogrammed devices are available. Ordering part numbers are assigned by Silicon Labs and the ClockBuilder Pro software utility. Custom part number format is “Si5386A-Exxxxx-GM” where “xxxxx” is a unique numerical sequence representing the preprogrammed configuration.

*See Ordering Guide table for current product revision.

** (Optional) 5 digits; assigned by ClockBuilder Pro for Custom, factory-preprogrammed OPN devices only;
(The “xxxxx” field is not included for “Base” OPNs).

Figure 2.1. Ordering Part Number Fields

3. Functional Description

The Si5386's internal DSPLL provides jitter attenuation and any-frequency multiplication of the selected input frequency without the need for (external) VCXOs and loop filters. Input switching is controlled manually or automatically using an internal state machine. The external oscillator provides a frequency reference which determines output frequency stability and accuracy while the device is in free-run or holdover mode. The high-performance MultiSynthdividers (N) generate integer or fractionally related output frequencies for the output stage. A crosspoint switch connects any of the MultiSynth generated frequencies to any of the outputs. Additional integer division (R) determines the final output frequency. Further, the DSPLL is specially calibrated for ultra-low phase noise when configured for CPRI frequencies with JESD204B outputs. This integration provides a clock-tree-on-a-chip solution for applications that need a mix of 4G/CPRI, Ethernet, and general-purpose frequencies.

3.1 Frequency Configuration

The frequency configuration of the DSPLL is programmable through the serial interface and can also be stored in non-volatile memory. The combination of fractional input dividers (P_n/P_d), fractional frequency multiplication (M_n/M_d), fractional output MultiSynth division (N_n/N_d), and integer output division (R_n) allows the generation of virtually any output frequency on any of the outputs with very low-phase noise suitable for wireless applications when synthesizing CPRI frequencies. All divider values for a specific frequency plan are easily determined using the ClockBuilder Pro utility.

3.2 DSPLL Loop Bandwidth

The DSPLL loop bandwidth determines the amount of input clock jitter attenuation. Register configurable DSPLL loop bandwidth settings in the range of 20 Hz to 4 kHz are available for selection. Since the loop bandwidth is controlled digitally, the DSPLL will always remain stable with less than 0.1 dB of peaking regardless of the loop bandwidth selection.

3.3 Fastlock Feature

Selecting a low DSPLL loop bandwidth (e.g., 20 Hz) will generally lengthen the lock acquisition time. The fastlock feature allows setting a temporary Fastlock Loop Bandwidth that is used during the lock acquisition process. Higher fastlock loop bandwidth settings will enable the DSPLLs to lock faster. Fastlock Loop Bandwidth settings of in the range of 20 Hz to 4 kHz are available for selection. The DSPLL will revert to its normal loop bandwidth once lock acquisition has completed.

3.4 Modes of Operation

Once initialization is complete the DSPLL operates in one of five modes: Free-run Mode, VCO Freeze Mode, Lock Acquisition Mode, Locked Mode, or Holdover Mode. A state diagram showing the modes of operation is shown in [Figure 3.1 Modes of Operation on page 7](#). The following sections describe each of these modes in greater detail.

3.4.1 Initialization and Reset

Once power is applied, the device begins an initialization period where it downloads default register values and configuration data from NVM and performs other initialization tasks. Communicating with the device through the serial interface is possible once this initialization period is complete. No clocks are generated until the initialization is complete. There are two types of resets available. A hard reset is functionally similar to a device power-up. All registers are restored to the values stored in NVM, and all circuits including the serial interface is restored to their initial state. A hard reset is initiated using the RSTb pin or by asserting the hard reset register bit. A soft reset bypasses the NVM download. It is simply used to initiate register configuration changes.

Figure 3.1. Modes of Operation

3.4.2 Freerun Mode

The DSPLL will automatically enter freerun mode once power is applied to the device and initialization is complete. The frequency accuracy of the generated output clocks in freerun mode is entirely dependent on the frequency accuracy of the reference clock on the XA/XB pins. For example, if the oscillator stability is ± 50 ppm, then all the output clocks will be generated at their configured frequency with ± 50 ppm stability in freerun mode. Any drift of the oscillator frequency is tracked at the output clock frequencies. Free run mode is maintained as long as no input clocks are valid.

3.4.3 Lock Acquisition Mode

The device monitors all inputs for a valid clock. If at least one valid clock is available for synchronization, the DSPLL automatically starts the lock acquisition process. If the fast lock feature is enabled, the DSPLL acquires lock using the Fastlock Loop Bandwidth setting and then transition to the DSPLL Loop Bandwidth setting when lock acquisition is complete. During lock acquisition, the output generates a clock that follows the VCO frequency change as it pulls in to the input clock frequency.

3.4.4 Locked Mode

Once locked, the DSPLL generates output clocks that are both frequency and phase locked to their selected input clocks. At this point, any oscillator frequency drift does not affect the output frequency. A loss of lock pin (LOL) and status bit indicate when lock is achieved. See [3.7.4 LOL Detection](#) for more details on the operation of the loss-of-lock circuit.

3.4.5 Holdover Mode

If holdover history is valid, the DSPLL automatically enters holdover mode when the selected input clock becomes invalid and no other valid input clocks are available for selection. The DSPLL uses an averaged input clock frequency as its final holdover frequency to minimize the disturbance of the output clock phase and frequency when an input clock suddenly fails. The holdover circuit for the DSPLL stores up to 120 seconds of historical frequency data while locked to a valid clock input. The final averaged holdover frequency value is calculated from a programmable window within the stored historical frequency data. Both the window size and the delay are programmable as shown in the figure below. The window size determines the amount of holdover frequency averaging. The delay value allows ignoring frequency data that may be corrupt just before the input clock failure.

Figure 3.2. Programmable Holdover Window

When entering holdover, the DSPLL pulls its output clock frequency to the calculated averaged holdover frequency. While in holdover, the output frequency drift is entirely dependent on the external reference clock connected to the XA/XB pins. If the clock input becomes valid, the DSPLL automatically exits the holdover mode and re-acquires lock to the new input clock. This process involves pulling the output clock frequency to achieve frequency and phase lock with the input clock. This pull-in process is glitchless and its rate is controlled by the DSPLL or the Fastlock bandwidth.

The DSPLL output frequency when exiting holdover can be ramped (recommended). Just before the exit is initiated, the difference between the current holdover frequency and the new desired frequency is measured. Using the calculated difference and a user-selectable ramp rate, the output is linearly ramped to the new frequency. The ramp rate can be 0.2 ppm/s, 40,000 ppm/s, or any of about 40 values in between. The DSPLL loop BW does not limit or affect ramp rate selections (and vice versa). CBPro defaults to ramped exit from holdover. The same ramp rate settings are used for both exit from holdover and ramped input switching. For more information on ramped input switching, see [3.6.4 Ramped Input Switching](#).

Note: If ramped holdover exit is not selected, the holdover exit is governed either by (1) the DSPLL loop BW or (2) a user-selectable holdover exit BW.

3.4.6 VCO Freeze Mode

If holdover history is not valid, the DSPLL automatically enters VCO Freeze mode when the selected input clock becomes invalid and no other valid input clocks are available for selection. The DSPLL uses the last measured input frequency to set the output frequencies in the VCO Freeze mode. If an input clock becomes valid, the DSPLL automatically exits the VCO Freeze mode and re-acquires lock to the new input clock.

3.5 External Reference (XA/XB)

An external crystal oscillator (XO) is required to set the reference for the Si5386. Only a 54 MHz XO is used as the reference to the wireless jitter attenuator. For the jitter and phase noise performance that is specified in this data sheet, the only XO's that can be used are the 54 MHz XO's recommended for the Si5381/82/86 in the [Si534x/8x Jitter Attenuators Recommended Crystal, TCXO and OCXOs Reference Manual](#).

Place the XO as close to the XaXb pins as possible. See figure below for guidelines on how to connect the XO to the XaXb input. C1 increases the slew rate to the Xa input, which is needed to get the jitter and phase noise performance that is specified in this data sheet.

Figure 3.3. XA/XB Input

3.6 Inputs (IN0, IN1, IN2, IN3)

There are four inputs that can be used to synchronize the DSPLL. The inputs accept both differential and single-ended clocks. Input selection can be manual (pin or register controlled) or automatic with user definable priorities. See the [Si5386 Rev. E Family Reference Manual](#) for details and input termination requirements.

3.6.1 Manual Input Switching (IN0, IN1, IN2, IN3)

Input clock selection can be made manually using the IN_SEL[1:0] pins or through a register. A register bit determines input selection as pin selectable or register selectable. The IN_SEL pins are selected by default. If there is no clock signal on the selected input, the device automatically enters free-run or holdover mode. When the zero delay mode is enabled, IN3 becomes the feedback input (FB_IN) and is not available for selection as a clock input.

Table 3.1. Manual Input Selection Using IN_SEL[1:0] Pins

| IN_SEL[1:0] | | Selected Input | |
|-------------|---|--------------------------|-------------------------|
| | | Zero Delay Mode Disabled | Zero Delay Mode Enabled |
| 0 | 0 | IN0 | IN0 |
| 0 | 1 | IN1 | IN1 |
| 1 | 0 | IN2 | IN2 |
| 1 | 1 | IN3 | Reserved |

3.6.2 Automatic Input Selection (IN0, IN1, IN2, IN3)

An automatic input selection state machine is available in addition to the manual switching option. In automatic mode, the selection criteria is based on input clock qualification, input priority, and the revertive option. Only input clocks that are valid can be selected by the automatic clock selection state machine. If there are no valid input clocks available the DSPLL will enter the holdover mode. With revertive switching enabled, the highest priority input with a valid input clock is always selected. If an input with a higher priority becomes valid then an automatic switchover to that input is initiated. With non-revertive switching, the active input always remains selected while it is valid. If it becomes invalid an automatic switchover to a valid input with the highest priority is initiated.

3.6.3 Hitless Input Switching

Hitless switching is a feature that prevents a phase offset from propagating to the output when switching between two clock inputs that have a fixed phase relationship. A hitless switch can only occur when the two input frequencies are frequency locked meaning that they have to be exactly at the same frequency, or at a fractional frequency relationship to each other. When hitless switching is enabled, the DSPLL simply absorbs the phase difference between the two input clocks during a input switch. When disabled, the phase difference between the two inputs is propagated to the output at a rate determined by the DSPLL Loop Bandwidth. The hitless switching feature supports clock frequencies down to the minimum input frequency of 7.68 MHz.

3.6.4 Ramped Input Switching

When switching between two plesiochronous input clocks (i.e., the frequencies are "almost the same" but not quite), ramped input switching should be enabled to ensure a smooth transition between the two inputs. Ramped input switching avoids frequency transients and overshoot when switching between frequencies and so is the default switching mode in CBPro. The feature should be turned off when switching between input clocks that are always frequency locked (i.e., are always the same exact frequency). The same ramp rate settings are used for both holdover exit and clock switching. For more information on ramped exit from holdover see [3.4.5 Holdover Mode](#).

3.6.5 Glitchless Input Switching

The DSPLL has the ability of switching between two input clock frequencies that are up to 40 ppm apart. The DSPLL will pull-in to the new frequency using the DSPLL Loop Bandwidth or using the Fastlock Loop Bandwidth if enabled. The loss of lock (LOL) indicator will assert while the DSPLL is pulling-in to the new clock frequency. There will be no abrupt phase change at the output during the transition.

3.7 Fault Monitoring

All four input clocks (IN0, IN1, IN2, IN3/FB_IN) are monitored for loss of signal (LOS) and out-of-frequency (OOF) as shown in the figure below. The reference at the XA/XB pins is also monitored for LOS since it provides a critical reference clock for the DSPLL. There is also a Loss Of Lock (LOL) indicator which is asserted when the DSPLL loses synchronization.

Figure 3.4. Si5386 Fault Monitors (Grade A)

3.7.1 Input LOS Detection

The loss of signal monitor measures the period of each input clock cycle to detect phase irregularities or missing clock edges. Each of the input LOS circuits has its own programmable sensitivity which allows ignoring missing edges or intermittent errors. Loss of signal sensitivity is configurable using the ClockBuilder Pro utility.

The LOS status for each of the monitors is accessible by reading a status register. The live LOS register always displays the current LOS state and a sticky register always stays asserted until cleared. An option to disable any of the LOS monitors is also available.

Figure 3.5. LOS Status Indicators

3.7.2 Reference Clock LOS Detection

A LOS monitor is available to ensure that the external reference oscillator is valid. By default the output clocks are disabled when XAXB_LOS is detected. This feature can be disabled such that the device will continue to produce output clocks when XAXB_LOS is detected.

3.7.3 OOF Detection

Each input clock is monitored for frequency accuracy with respect to a OOF reference which it considers as its “0_ppm” reference. This OOF reference can be selected as either:

- The XA/XB reference
- Any input clock (IN0, IN1, IN2, IN3)

The final OOF status is determined by the combination of both a precise OOF monitor and a fast OOF monitor as shown in the figure below. An option to disable either monitor is also available. The live OOF register always displays the current OOF state, and its sticky register bit stays asserted until cleared.

Figure 3.6. OOF Status Indicator

3.7.3.1 Precision OOF Monitor

The precision OOF monitor circuit measures the frequency of all input clocks to within ± 1 ppm accuracy with respect to the selected OOF frequency reference. A valid input clock frequency is one that remains within the OOF frequency range which is register configurable up to 511 ppm in steps of 1/16 ppm. If the Xa input is chosen as the frequency reference, then the minimum OOF assert threshold should be 60 ppm or greater to account for the ± 50 ppm error from the recommended XO at the Xa input. A configurable amount of hysteresis is also available to prevent the OOF status from toggling at the failure boundary. An example is shown in the figure below. In this case, the OOF monitor is configured with a valid frequency range of ± 60 ppm and with 2 ppm of hysteresis. An option to use one of the input pins (IN0–IN3) as the 0 ppm OOF reference instead of the external XO reference is available. This option is register configurable.

Figure 3.7. Example of Precise OOF Monitor Assertion and Deassertion Triggers

3.7.3.2 Fast OOF Monitor

Because the precision OOF monitor needs to provide 1/16 ppm of frequency measurement accuracy, it must measure the monitored input clock frequencies over a relatively long period of time. This may be too slow to detect an input clock that is quickly ramping in frequency. An additional level of OOF monitoring called the Fast OOF monitor runs in parallel with the precision OOF monitors to quickly detect a ramping input frequency. The Fast OOF monitor asserts OOF on an input clock frequency that has changed by greater than $\pm 1,000$ ppm to $\pm 16,000$ ppm. This threshold can be configured in CBPro.

3.7.4 LOL Detection

The Loss Of Lock (LOL) monitor asserts a LOL register bit when the DSPLL has lost synchronization with its selected input clock.

There is also a dedicated loss of lock pin that reflects the loss of lock condition. The LOL monitor functions by measuring the frequency difference between the input and feedback clocks at the phase detector. There are two LOL frequency monitors, one that sets the LOL indicator (LOL Set) and another that clears the indicator (LOL Clear). An optional timer is available to delay clearing of the LOL indicator to allow additional time for the DSPLL to completely lock to the input clock. The timer is also useful to prevent the LOL indicator from toggling or chattering as the DSPLL completes lock acquisition. A block diagram of the LOL monitor is shown in the figure below. The live LOL register always displays the current LOL state and a sticky register always stays asserted until cleared. The LOL pin reflects the current state of the LOL monitor.

Figure 3.8. LOL Status Indicators

The LOL frequency monitors have an adjustable sensitivity which is register configurable from 0.1 ppm to 10,000 ppm. Having two separate frequency monitors allows for hysteresis to help prevent chattering of LOL status.

An example configuration where LOCK is indicated when there is less than 0.1 ppm frequency difference at the inputs of the phase detector and LOL is indicated when there's more than 1 ppm frequency difference is shown in the following figure.

Figure 3.9. LOL Set and Clear Thresholds

Note: In this document, the terms, LVDS and LVPECL, refer to driver formats that are compatible with these signaling standards.

An optional timer is available to delay clearing of the LOL indicator to allow additional time for the DSPLL to completely lock to the input clock. The timer is also useful to prevent the LOL indicator from toggling or chattering as the DSPLL completes lock acquisition. The configurable delay value depends on frequency configuration and loop bandwidth of the DSPLL and is automatically calculated using the ClockBuilder Pro utility.

3.7.5 Interrupt Pin (INTRb)

An interrupt pin (INTRb) indicates a change in state of the status indicators (LOS, OOF, LOL, HOLD). Any of the status indicators are maskable to prevent assertion of the interrupt pin. The state of the INTRb pin is reset by clearing the status register that caused the interrupt.

3.8 Outputs

The Si5386 supports up to twelve differential output drivers. Each driver has a configurable voltage swing and common mode voltage covering a wide variety of differential signal formats. In addition to supporting differential signals, any of the outputs can be configured as single-ended LVCMOS (3.3 V, 2.5 V, or 1.8 V) providing up to 24 single-ended outputs, or any combination of differential and single-ended outputs.

3.8.1 Output Crosspoint

A crosspoint allows any of the output drivers to connect with any of the MultiSynths as shown in the figure below. The crosspoint configuration is programmable and can be stored in NVM so that the desired output configuration is ready at power up.

Figure 3.10. MultiSynth to Output Driver Crosspoint

3.8.2 Output Signal Format

The differential output swing and common mode voltage are both fully programmable covering a wide variety of signal formats including LVDS and LVPECL. In addition to supporting differential signals, any of the outputs can be configured as LVCMOS (3.3 V, 2.5 V, or 1.8 V) drivers providing up to 24 single-ended outputs, or any combination of differential and single-ended outputs.

3.8.3 Output Terminations

The output drivers support both ac-coupled and dc-coupled terminations as shown in the following figure.

Figure 3.11. Supported Output Terminations

3.8.4 Programmable Amplitude For Differential Outputs

See the [Si5386 Rev. E Reference Manual](#) Appendix for programming the outputs to variable amplitudes when AC coupled.

3.8.5 LVC MOS Output Impedance and Drive Strength Selection

Each LVC MOS driver has a configurable output impedance to accommodate different trace impedances and drive strengths. A source termination resistor is recommended to help match the selected output impedance to the trace impedance. There are three programmable output impedance selections for each VDDO options as shown in the table below.

Table 3.2. LVC MOS Output Impedance and Drive Strength Selections

| VDDO | OUTx_CMOS_DRV | Source Impedance (Zs) | Drive Strength (Iol/Ioh) |
|--|---------------|-----------------------|--------------------------|
| 3.3 V | 0x01 | 38 Ω | 10 mA |
| | 0x02 | 30 Ω | 12 mA |
| | 0x03* | 22 Ω | 17 mA |
| 2.5 V | 0x01 | 43 Ω | 6 mA |
| | 0x02 | 35 Ω | 8 mA |
| | 0x03* | 24 Ω | 11 mA |
| 1.8 V | 0x03* | 31 Ω | 5 mA |
| Note: Use of the lowest impedance setting is recommended for all supply voltages for best edge rates. | | | |

3.8.6 LVC MOS Output Signal Swing

The signal swing (V_{OL}/V_{OH}) of the LVC MOS output drivers is set by the voltage on the VDDO pins. Each output driver has its own VDDO pin allowing a unique output voltage swing for each of the LVC MOS drivers.

3.8.7 LVC MOS Output Polarity

When a driver is configured as an LVC MOS output, it generates a clock signal on both pins (OUTx and OUTxb). By default, the clock on the OUTx pin is generated with the same polarity (in phase) as the clock on the OUTxb pin. The polarity of these clocks is configurable, enabling complementary clock generation and/or inverted polarity with respect to other output drivers.

3.8.8 Output Enable/Disable

The OEb pin provides a convenient method of disabling or enabling all of the output drivers at the same time. When the OEb pin is held high all outputs will be disabled. When held low, the outputs will all be enabled. Outputs in the enabled state can still be individually disabled through register control.

3.8.9 Output Disable During LOL

By default, a DSPLL that is out of lock will generate either free-running clocks or generate clocks in holdover mode. There is an option to disable the outputs when a DSPLL is LOL. This option can be useful to force a downstream PLL into holdover.

3.8.10 Output Disable During Reference LOS

The external XA/XB reference provides a critical function for the operation of the DSPLLs. In the event of the XO failure, the device will assert an XAXB_LOS alarm. By default, all outputs will be disabled during assertion of the XAXB_LOS alarm. There is an option to leave the outputs enabled during an XAXB_LOS alarm, but the frequency accuracy and stability is indeterminate during this fault condition.

3.8.11 Output Driver State When Disabled

The disabled state of an output driver is configurable as disable low or disable high.

3.8.12 Synchronous Output Disable Feature

The output drivers provide a selectable synchronous disable feature. Output drivers with this feature turned on will wait until a clock period has completed before the driver is disabled. This prevents unwanted runt pulses from occurring when disabling an output. When this feature is turned off, the output clock will disable immediately without waiting for the period to complete.

3.8.13 Static Output Skew Control

The static phase adjust will allow a programmable phase offset between outputs on different N dividers. The resolution of the static phase adjustment is 68 ps with up to ± 1 ms of total range. This feature is intended for use in JESD204B subclass 1 applications to adjust the phase of SYSREF signals with respect to DCLK. See the family [Reference Manual](#) and Application Note [AN1165: Configuring Si538x Devices for JESD204B/C Wireless Applications](#) for more details.

3.8.14 Dynamic Output Skew Control

The dynamic phase adjust will allow the device to dynamically and glitchlessly change the outputs phase using register writes while the device remains locked. The resolution of the dynamic phase adjustment is 68 ps step size with up to ± 1 ms of total range. See the family [Reference Manual](#) for more details.

3.8.15 Zero Delay Mode

Zero delay mode is configured by opening the internal feedback loop through software configuration and closing the loop externally around as shown in the figure below. This helps to cancel out the internal delay introduced by the dividers, the crosspoint, the input, and the output drivers. Any output can be fed back to the IN3/FB_IN pins, although using the output driver that achieves the shortest trace length will help to minimize the input-to-output delay. The OUT9A and IN3/FB_IN pins are recommended for the external feedback connection. The FB_IN input pins must be terminated and ac-coupled when zero delay mode is used. A differential external feedback path connection is necessary for best performance. The order of the OUT9A and FB_IN polarities is such that they may be routed on the device side of the PCB without requiring vias or needing to cross each other.

Figure 3.12. Si5386 Zero Delay Mode Setup

3.8.16 Output Divider (R) Synchronization

All the output R dividers are reset to a known state during the power-up initialization period. This ensures consistent and repeatable phase alignment across all output drivers. Resetting the device using the RSTb pin or asserting the hard reset bit will have the same result.

3.9 Power Management

Unused inputs and output drivers can be powered down when unused. Consult the [Reference Manual](#) and ClockBuilder Pro configuration utility for details.

3.10 In-Circuit Programming

The Si5386 is fully configurable using the serial interface (I²C or SPI). At power-up the device downloads its default register values from internal non-volatile memory (NVM). Application specific default configurations can be written into NVM allowing the device to generate specific clock frequencies at power-up. Writing default values to NVM is in-circuit programmable with normal operating power supply voltages applied to its V_{DD} and V_{DDA} pins. The NVM is two time writable. Once a new configuration has been written to NVM, the old configuration is no longer accessible. Refer to the [Reference Manual](#) for a detailed procedure for writing registers to NVM.

3.11 Serial Interface

Configuration and operation of the Si5386 is controlled by reading and writing registers using the I²C or SPI interface. The I2C_SEL pin selects I²C or SPI operation. Communication with both 3.3 V and 1.8 V host is supported. The SPI mode operates in either 4-wire or 3-wire. The SCLK in SPI mode does not need to be present when CSb is high. See the timing diagram for SPI and the [Reference Manual](#) for details.

3.12 Custom Factory Preprogrammed Parts

For applications where a serial interface is not available for programming the device, custom pre-programmed parts can be ordered with a specific configuration written into NVM. A factory preprogrammed part will generate clocks at power-up. Custom, factory-preprogrammed devices are available. The ClockBuilder Pro [custom part number wizard](#) can be used to quickly and easily generate a custom part number for your configuration.

In less than three minutes, you will be able to generate a custom part number with a detailed data sheet addendum matching your design's configuration. Once you receive the confirmation email with the data sheet addendum, simply place an order with your local Silicon Labs sales representative. Samples of your preprogrammed device will typically ship in about two weeks.

3.13 Enabling Features and/or Configuration Settings Unavailable in ClockBuilder Pro for Factory Preprogrammed Devices

As with essentially all modern software utilities, ClockBuilder Pro is continually being updated and enhanced. By registering at www.silabs.com, you will be notified about changes and their impact. This update process will ultimately enable ClockBuilder Pro users to access all features and register setting values documented in this data sheet and the [Reference Manual](#).

However, if you must enable or access a feature or register setting value so that the device starts up with this feature or a register setting, but the feature or register setting is not yet available in CBPro, you must contact a Silicon Labs applications engineer for assistance. One example of this type of feature or custom setting is the customizable output amplitude and common voltages for the clock outputs. After careful review of your project file and requirements, the Silicon Labs applications engineer will email back your CBPro project file with your specific features and register settings enabled using what's referred to as the manual "settings override" feature of CBPro. "Override" settings to match your request(s) will be listed in your design report file. Examples of setting "overrides" in a CBPro design report are shown in the following table.

Table 3.3. Setting Overrides

| Location | Name | Type | Target | Dec Value | Hex Value |
|-------------|-----------------|--------|-------------|-----------|-----------|
| 0x0435[0] | FORCE_HOLD_PLLA | No NVM | N/A | 1 | 0x1 |
| 0x0B48[0:4] | OOF_DIV_CLK_DIS | User | OPN and EVB | 0 | 0x00 |

Once you receive the updated design file, simply open it in CBPro. The device will begin operation after startup with the values in the NVM file. The flowchart for this process is shown in the following figure.

Figure 3.13. Process for Requesting Non-Standard CBPro Features

Note: Contact Silicon Labs Technical Support at www.silabs.com/support/Pages/default.aspx.

4. Register Map

The register map is divided into multiple pages where each page has 256 addressable registers. Page 0 contains frequently accessible registers, such as alarm status, resets, device identification, etc. Other pages contain registers that need less frequent access such as frequency configuration, and general device settings. A high level map of the registers is shown in “6.2. High-Level Register Map”. Refer to the [Reference Manual](#) for a complete list of register descriptions and settings. Silicon Labs strongly recommends using [ClockBuilder Pro](#) to create and manage register settings.

4.1 Addressing Scheme

The device registers are accessible using a 16-bit address that consists of an 8-bit page address plus an 8-bit register address. By default, the page address is set to 0x00. Changing to another page is accomplished by writing to the “Set Page Address” byte located at address 0x01 of each page.

4.2 High-Level Register Map

Table 4.1. High-Level Register Map

| 16-Bit Address | | Content |
|--------------------|------------------------------|----------------------------------|
| 8-bit Page Address | 8-bit Register Address Range | |
| 00 | 00 | Revision IDs |
| | 01 | Set Page Address |
| | 02–0A | Device IDs |
| | 0B–15 | Alarm Status |
| | 17–1B | INTR Masks |
| | 1C | Reset controls |
| | 1D | FINC, FDEC Control Bits |
| | 2B | SPI (3-Wire vs 4-Wire) |

| | V _{IN_DIFF} | Differential Input | 365 | — | 2500 | mVpp_diff |
| Slew Rate ^{2, 3} | SR | Single-ended Input | 1500 | — | — | V/μs |
| | SR _{IN_DIFF} | Differential Input | 400 | — | — | V/μs |
| Input Duty Cycle | DC | | 40 | — | 60 | % |
| Activity Dip ⁸ | | | | | 2 | ppm/C |

(V_{DD} = 1.8 V ±5%, V_{DDA} = 3.3 V ±5%, T_A = –40 to 85 °C)

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
|--|--------|----------------|-----|-----|-----|------|
| Note: | | | | | | |
| 1. Voltage swing is specified as single-ended mVpp. | | | | | | |
|  | | | | | | |
| 2. Recommended for specified jitter performance. Slew rate can go lower, but jitter performance could degrade if the minimum slew rate specification is not met (see the Si5386 Reference Manual). | | | | | | |
| 3. Rise and fall times can be estimated using the following simplified equation: $tr/tf_{80-20} = ((0.8 - 0.2) \times V_{IN_Vpp_se}) / SR$. | | | | | | |
| 4. Standard, Non-standard and Pulsed CMOS refer to different formats of CMOS each with a voltage swing of 1.8V, 2.5V or 3.3V +/-5%. | | | | | | |
| <ul style="list-style-type: none"> • Standard CMOS refers to the industry standard LVCMOS signal. • Non-standard CMOS refers to a signal that has been attenuated/level-shifted in order to comply with the specified non-standard VIL and VIH specifications. • Pulsed CMOS refers to a signal that has been attenuated/level-shifted and has a low/high duty cycle and must be dc coupled. A typical application example is a low-frequency video frame sync pulse. | | | | | | |
| Refer to the Si5386 Reference Manual for the recommended connections/termination for the different modes. | | | | | | |
| 5. CMOS signals that exceed 3.3 V + 5% can be used as inputs as long as a resistive attenuation network is used to guarantee that the input voltage at the pin does not violate the device's input ratings. Please refer to the Si5386 Reference Manual for the recommended connections/termination for this mode. | | | | | | |
| 6. Refer to the Si534x/8x Jitter Attenuators Recommended Crystal, TCXO and OCXOs Reference Manual for recommended 54 MHz XOs. | | | | | | |
| 7. Includes aging and temperature affects. | | | | | | |
| 8. Activity dip is also called frequency perturbation. | | | | | | |

Table 5.4. Serial and Control Input Pin Specifications

| (V _{DD} = 1.8 V ±5%, V _{DDA} = 3.3 V ±5%, V _{DDS} = 3.3 V ±5%, 1.8 V ±5%, T _A = –40 to 85 °C) | | | | | | |

| | | 100 kHz sinusoidal noise | — | –96 | — | |
| | | 500 kHz sinusoidal noise | — | –99 | — | |
| | | 1 MHz sinusoidal noise | — | –97 | — | |
| Output-output Crosstalk ⁴ | XTALK | Differential | — | –72 | — | dB |

Note:

1. Output amplitude and common mode voltage are programmable through register settings and can be stored in NVM. Each output driver can be programmed independently. The typical normal mode (or low power mode) LVDS maximum is 100 mV (or 80 mV) higher than the TIA/EIA-644 maximum. Refer to the Si5386 Reference Manual for recommended output settings.
2. Not all combinations of voltage amplitude and common mode voltages settings are possible.
3. Measured for 156.25 MHz carrier frequency. Sinewave noise added to VDDO (1.8 V = 50 mVpp, 2.5 V/3.3 V = 100 mVpp) and noise spur amplitude measured.
4. Measured across two adjacent outputs, both in LVDS mode, with the victim running at 122.88 MHz and the aggressor at 156.25 MHz. Refer to application note, ["AN862: Optimizing Si534x Jitter Performance in Next Generation Internet Infrastructure Systems"](#), guidance on crosstalk minimization. Note that all active outputs must be terminated when measuring crosstalk.
5. VDDO = 2.5 V or 3.3 V required for f_{OUT} > 1474.56 MHz
6. For any R divider settings that differ by a power of 2.

**Differential Output Test Configuration****Table 5.6. LVC MOS Clock Output Specifications**(V_{DD} = 1.8 V ±5%, V_{DDA} = 3.3 V ±5%, V_{DDO} = 1.8 V ±5%, 2.5 V ±5%, or 3.3 V ±5%, T_A = –40 to 85 °C)

| | | V _{DDO} = 2.5 V | | — | 450 | 600 | ps |
| | | V _{DDO} = 1.8 V | | — | 550 | 750 | ps |

(V_{DD} = 1.8 V ±5%, V_{DDA} = 3.3 V ±5%, V_{DDO} = 1.8 V ±5%, 2.5 V ±5%, or 3.3 V ±5%, T_A = –40 to 85 °C)

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
|---|--------|--|-----|-----|-----|------|
| Note: | | | | | | |
| 1. Driver strength is a register programmable setting and stored in NVM. Options are OUTx_CMOS_DRV = 1, 2, 3. Refer to the Si5386 Reference Manual for more details on register settings. | | | | | | |
| 2. IOL/IOH is measured at VOL/VOH as shown in the dc test configuration. | | | | | | |
| 3. A series termination resistor (Rs) is recommended to help match the source impedance to a 50 Ω PCB trace. A 4.7 pF capacitive load is assumed. The LVC MOS outputs were set to OUTx_CMOS_DRV = 3, at 156.25 MHz. | | | | | | |

Table 5.7. Output Serial and Status Pin Specifications

| (V _{DD} = 1.8 V ±5%, V _{DDA} = 3.3 V ±5%, V _{DDO} = 3.3 V ±5%, 1.8 V ±5%, T _A = –40 to 85 °C) | | | | | | |
|--|-----------------|----------------|---------------------------------------|-----|---------------------------------------|------|
| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
| Serial and Status Output Pins (INTRb, LOLb, SDA/SDIO ² , A1/SDO) | | | | | | |
| Output Voltage | V _{OH} | IOH = –2 mA | V _{DDIO} ¹ × 0.85 | — | — | V |
| | V _{OL} | IOL = 2 mA | — | — | V _{DDIO} ¹ × 0.15 | V |
| Note: | | | | | | |
| 1. V _{DDIO} is determined by the IO_VDD_SEL bit. It is selectable as VDDA or VDD. Users normally select this option in the ClockBuilder Pro GUI. Alternatively, refer to the Si5386 Reference Manual for more details on register settings. | | | | | | |
| 2. The V _{OH} specification does not apply to the open-drain SDA/SDIO output when the serial interface is in I2C mode or is unused with I2C_SEL pulled high internally. V _{OL} remains valid in all cases. | | | | | | |

Table 5.8. Performance Characteristics

| (V _{DD} = 1.8 V ±5%, or 3.3 V ±5%, V _{DDA} = 3.3 V ±5%, T _A = –40 to 85 °C) | | | | | | |

| Phase Noise Performance ³ (122.88 MHz Carrier Frequency) | PN | 100 Hz | — | -118 | — | dBc/Hz |
| | | 1 kHz | — | -133 | — | dBc/Hz |
| | | 10 kHz | — | -142 | — | dBc/Hz |
| | | 100 kHz | — | -149 | — | dBc/Hz |
| | | 1 MHz | — | -154 | — | dBc/Hz |
| | | 10 MHz | — | -165 | — | dBc/Hz |
| MultiSynth Spur Performance | SPUR | From 1 MHz to 30 MHz offset | — | -95 | — | dBc |

Note:

1. Lock Time can vary significantly depending on several parameters, such as bandwidths, LOL thresholds, etc. For this case, lock time was measured with nominal bandwidth set to 100 Hz, fastlock bandwidth set to 1 kHz, LOL set/clear thresholds of 6/0.6 ppm respectively, using IN0 as clock reference by removing the reference and enabling it again, then measuring the delta time between the first rising edge of the clock reference and the LOL indicator deassertion.
2. Measured as time from valid VDD/VDDA rails (90% of their value) to when the serial interface is ready to respond to commands.
3. Jitter generation test conditions: f_{IN} = f_{OUT} = 122.88 MHz, DSPLL LBW = 20 Hz. Jitter integrated from 12 kHz to 20 MHz offset. Does not include jitter from PLL input reference.

| Maximum Junction Temperature in Operation | T _{JCT} | | | 125 °C |
| Storage Temperature Range | T _{STG} | | | –55 to +150 °C |
| Soldering Temperature (Pb-free profile) ² | T _{PEAK} | | | 260 °C |
| Soldering Temperature Time at T _{PEAK} (Pb-free profile) ³ | T _P | | | 20–40 sec |

Note:

1. Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as specified in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. For detailed MSL and packaging information, go to [RoHS Information](#).
3. The device is compliant with JEDEC J-STD-020.

6. Detailed Block Diagrams

Figure 6.1. Si5386 Block Diagram

7. Typical Operating Characteristics

The phase noise plots below were taken under the following conditions: $V_{DD} = 1.8$ V; $V_{DDA} = 3.3$ V; $V_{DDS} = 3.3$ V, 1.8 V; OLBW = 40Hz; $T_a = 25$ °C.

Figure 7.2. $f_{IN} = 156.25$ MHz, $f_{OUT} = 156.25$ MHzFigure 7.3. $f_{IN} = 322.265625$ MHz, $f_{OUT} = 322.265625$ MHz

8. Pin Descriptions

Top View (Grade A)

Table 8.1. Si5386 Pin Descriptions

| Pin Name | Pin Number | Pin Type ¹ | Function |
|------------|------------|-----------------------|---|
| Inputs | | | |
| IN0 | 63 | I | Clock Inputs. These pins accept an input clock for synchronizing the device. They support both differential and single-ended clock signals. Refer to section 3.6 Inputs (IN0, IN1, IN2, IN3) for input termination options. These pins are high-impedance and must be terminated externally, when being used. The negative side of the differential input must be ac-grounded when accepting a single-ended clock. Unused inputs may be left unconnected. |
| IN0b | 64 | I | |
| IN1 | 1 | I | |
| IN1b | 2 | I | |
| IN2 | 14 | I | |
| IN2b | 15 | I | |
| IN3/FB_IN | 61 | I | Clock Input 3/External Feedback Input. |
| IN3/FB_INb | 62 | I | By default, these pins are used as the 4th clock input (IN3/IN3). They can also be used as the external feedback input (FB_IN/FB_IN) for the optional zero delay mode. See section 3.6.1 Manual Input Switching (IN0, IN1, IN2, IN3) for details on the optional zero delay mode. |
| Outputs | | | |

| Pin Name | Pin Number | Pin Type ¹ | Function |
|------------------|------------|-----------------------|--|
| OUT0A | 21 | O | |
| OUT0Ab | 20 | O | |
| OUT0 | 24 | O | |

| OUT9A | 59 | O | |
| OUT9Ab | 58 | O | |
| Serial Interface | | | |
| I2C_SEL | 39 | I | I2C Select. This pin selects the serial interface mode as I2C (I2C_SEL = 1) or SPI (I2C_SEL = 0). This pin is internally pulled high. |
| SDA/SDIO | 18 | I/O | Serial Data Interface. This is the bidirectional data pin (SDA) for the I2C mode, the bidirectional data pin (SDIO) in the 3-wire SPI mode, or the input data pin (SDI) in 4-wire SPI mode. When in I2C mode, this pin must be pulled-up using an external resistor of at least 1 kΩ. No pull-up resistor is needed when in SPI mode. This pin is 3.3 V tolerant. |

| Pin Name | Pin Number | Pin Type ¹ | Function |
|----------------|------------|-----------------------|--|
| A1/SDO | 17 | I/O | Address Select 1/Serial Data Output. In I2C mode this pin functions as the A1 address input pin. In 4-wire SPI mode, this is the serial data output (SDO) pin. This pin is 3.3 V tolerant. |
| SCLK | 16 | I | Serial Clock Input. This pin functions as the serial clock input for both I2C and SPI modes. When in I2C mode, this pin must be pulled-up using an external resistor of at least 1 kΩ. No pull-up resistor is needed when in SPI mode. This pin is 3.3 V tolerant. |
| A0/CSb | 19 | I | Address Select 0/Chip Select. This pin functions as the hardware controlled address A0 in I2C mode. In SPI mode, this pin functions as the chip select input (active low). This pin is internally pulled-up. This pin is 3.3 V tolerant. |
| Control/Status | | | |
| INTRb | 12 | O | Interrupt². This pin is asserted low when a change in device status has occurred. It should be left unconnected when not in use. This pin has a push-pull driver and does not need a pull-up resistor. |
| PDNb | 5 | I | Power Down². The device enters into a low power mode when this pin is pulled low. This pin is internally pulled-up. This pin is 3.3 V tolerant. It can be left unconnected when not in use. |
| RSTb | 6 | I | Device Reset.² Active low input that performs power-on reset (POR) of the device. Resets all internal logic to a known state and forces the device registers to their default values. Clock outputs are disabled during reset. This pin is internally pulled-up. This pin is 3.3 V tolerant. |
| OEb | 11 | I | Output Enable². This pin disables all outputs when held high. This pin is internally pulled low and can be left unconnected when not in use. This pin is 3.3 V tolerant. |

| Pin Name | Pin Number | Pin Type ¹ | Function |
|----------|------------|-----------------------|--|
| LOLb | 47 | O | Loss Of Lock ² . This output pin indicates when the DSPLL is locked (high) or out-of-lock (low). It can be left unconnected when not in use. |
| SYNC | 48 | I | Output Clock Synchronization ² . An active low signal on this pin resets the output dividers for the purpose of re-aligning the output clocks. This pin is internally pulled-up and can be left unconnected when not in use. |
| IN_SEL0 | 3 | I | Input Reference Select ² . The IN_SEL[1:0] pins are used in manual pin controlled mode to select the active clock input as shown in Table 3.1 Manual Input Selection Using IN_SEL[1:0] Pins on page 9 |
| IN_SEL1 | 4 | I | |
| XA | 8 | I | Oscillator input. Single-ended input must be connected to the XA pin, with the XB pin appropriately terminated. |
| XB | 9 | I | |
| RSVD | 7 | NC | Reserved. Leave disconnected. |
| | 10 | NC | |
| | 25 | NC | |
| Power | | | |
| VDD | 32 | P | Core Supply Voltage. The device operates from a 1.8 V supply. A 1 uF bypass capacitor should be placed very close to each pin. |
| VDD | 46 | P | |
| VDD | 60 | P | |
| VDDA | 13 | P | Core Supply Voltage 3.3 V. This core supply pin requires a 3.3 V power source. A 1 uF bypass capacitor should be placed very close to this pin. |

| Pin Name | Pin Number | Pin Type ¹ | Function |
|----------|------------|-----------------------|---|
| VDDO0 | 22 | P | Output Clock Supply Voltage. Supply voltage (3.3 V, 2.5 V, 1.8 V) for OUTn, OUTn outputs. Note that VDDO0 supplies power to OUT0 and OUT0A; VDDO9 supplies power to OUT9 and OUT9A. Leave VDDO pins of unused output drivers unconnected. An alternative option is to connect the VDDO pin to a power supply and disable the output driver to minimize current consumption. |
| VDDO1 | 26 | P | |
| VDDO2 | 29 | P | |
| VDDO3 | 33 | P | |
| VDDO4 | 36 | P | |
| VDDO5 | 40 | P | |
| VDDO6 | 43 | P | |
| VDDO7 | 49 | P | |
| VDDO8 | 52 | P | |
| VDDO9 | 57 | P | |
| GND PAD | | P | Ground Pad. This pad provides connection to ground and must be connected for proper operation. |

Note:

1. I = Input, O = Output, P = Power
2. The IO_VDD_SEL control bit (0x0943 bit 0) selects 3.3 V or 1.8 V operation.

9. Package Outlines

9.1 Si5386 9x9 mm 64-QFN Package Diagram

Figure 9.1. Si5386 9x9 mm 64-QFN Package Diagram

| D2 | 5.10 | 5.20 | 5.30 |
| e | | 0.50 BSC | |
| E | | 9.00 BSC | |
| E2 | 5.10 | 5.20 | 5.30 |
| L | 0.30 | 0.40 | 0.50 |
| aaa | — | — | 0.15 |
| bbb | — | — | 0.10 |
| ccc | — | — | 0.08 |
| ddd | — | — | 0.10 |

Note:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-220.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

10. PCB Land Pattern

The following figure illustrates the PCB land pattern details for the devices. The table lists the values for the dimensions shown in the illustration.

Figure 10.1. PCB Land Pattern

Table 10.1. PCB Land Pattern Dimensions

| Dimension | Si5386 (Max) |
|-----------|--------------|
| C1 | 8.6 |
| C2 | 8.6 |
| E | 0.50 |
| X1 | 0.30 |
| Y1 | 0.50 |
| X2 | 5.5 |
| Y2 | 5.5 |

Notes:**General**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.
3. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition is calculated based on a fabrication Allowance of 0.05 mm.

Solder Mask Design

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design

1. A stainless steel, laser-cut and electropolished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 0.65mm square openings on a 0.90mm pitch should be used for the center ground pad.

Card Assembly

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

11. Top Marking

Figure 11.1. Si5386 Top Marking

Table 11.1. Top Marking Explanation

| Line | Characters | Description |
|------|------------------------------------|--|
| 1 | Si538fg- | Base part number and Device Grade for Any-frequency, Any-output, Jitter Cleaning Clock (single PLL): f = 6, 12-Output LTE + Ethernet Clock g = Grade (internal versus external crystal oscillator option) |
| 2 | Rxxxxx-GM | R = Product revision. (Refer to 2. Ordering Guide for latest revision). xxxxx = Customer specific NVM sequence number. Optional NVM code assigned for custom, factory pre-programmed devices. Characters are not included for standard, factory default configured devices. See 2. Ordering Guide for more information. -GM = Package (LGA) and temperature range (-40 to +85 °C) |
| 3 | YYWWTTTTTT | YYWW = Characters correspond to the year (YY) and work week (WW) of package assembly. TTTTTT = Manufacturing trace code. |
| 4 | Circle w/ 1.6 mm (64-QFN) diameter | Pin 1 indicator; left-justified |
| | e4 | Pb-free symbol; Center-Justified |
| | TW | TW = Taiwan; Country of Origin (ISO Abbreviation) |

12. Device Errata

Information in this document is provided in connection with Skyworks Solutions, Inc. ("Skyworks") products or services. These materials, including the information contained herein, are provided by Skyworks as a service to its customers and may be used for informational purposes only by the customer. Skyworks assumes no responsibility for errors or omissions in these materials or the information contained herein. Skyworks may change its documentation, products, services, specifications or product descriptions at any time, without notice. Skyworks makes no commitment to update the materials or information and shall have no responsibility whatsoever for conflicts, incompatibilities, or other difficulties arising from any future changes.

No license, whether express, implied, by estoppel or otherwise, is granted to any intellectual property rights by this document. Skyworks assumes no liability for any materials, products or information provided hereunder, including the sale, distribution, reproduction or use of Skyworks products, information or materials, except as may be provided in Skyworks' Terms and Conditions of Sale.

THE MATERIALS, PRODUCTS AND INFORMATION ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE, INCLUDING FITNESS FOR A PARTICULAR PURPOSE OR USE, MERCHANTABILITY, PERFORMANCE, QUALITY OR NON-INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHT; ALL SUCH WARRANTIES ARE HEREBY EXPRESSLY DISCLAIMED. SKYWORKS DOES NOT WARRANT THE ACCURACY OR COMPLETENESS OF THE INFORMATION, TEXT, GRAPHICS OR OTHER ITEMS CONTAINED WITHIN THESE MATERIALS. SKYWORKS SHALL NOT BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO ANY SPECIAL, INDIRECT, INCIDENTAL, STATUTORY, OR CONSEQUENTIAL DAMAGES, INCLUDING WITHOUT LIMITATION, LOST REVENUES OR LOST PROFITS THAT MAY RESULT FROM THE USE OF THE MATERIALS OR INFORMATION, WHETHER OR NOT THE RECIPIENT OF MATERIALS HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Skyworks products are not intended for use in medical, lifesaving or life-sustaining applications, or other equipment in which the failure of the Skyworks products could lead to personal injury, death, physical or environmental damage. Skyworks customers using or selling Skyworks products for use in such applications do so at their own risk and agree to fully indemnify Skyworks for any damages resulting from such improper use or sale.

Customers are responsible for their products and applications using Skyworks products, which may deviate from published specifications as a result of design defects, errors, or operation of products outside of published parameters or design specifications. Customers should include design and operating safeguards to minimize these and other risks. Skyworks assumes no liability for applications assistance, customer product design, or damage to any equipment resulting from the use of Skyworks products outside of Skyworks' published specifications or parameters.
