

IS31BL3508A 1.0MHZ BOOST CONVERTER WITH 38V INTERNAL MOSFET SWITCH

DESCRIPTION

IS31BL3508A is a 2.7V~5.5V (input voltage) backlight LED boost converter with an integrated MOSFET switch. It is designed for driving a string of LEDs or other devices in a constant current mode. The device regulates the LED load current using an external, low value sensing resistor. The device adjusts the PWM duty cycle of the switch to maintain the voltage at the FB pin at a value of 0.3V. The IS31BL3508A operates at a constant switching frequency of 1.0MHz to utilize small component sizes. It features an over voltage shutdown pin which prevents the output voltage from exceeding 38V (typ.) for open circuit condition.

FEATURES

- Supply voltage: 2.7V~5.5V
- Built-in soft start
- Drive series strings of 10 LEDs
- PWM or DC voltage dimming
- Frequency of PWM is 500Hz ~ 500kHz
- 1.0MHz high speed switching frequency
- 300mV feedback voltage
- Integrated high power MOSFET
- Over voltage protection
- -40°C ~ +85°C working temperature range
- TSOT-23-6 and SOT-23-6 package

QUICK START

Figure 1: Photo of IS31BL3508A Evaluation Board

RECOMMENDED EQUIPMENT

- 5.0V, 2A power supply

ABSOLUTE MAXIMUM RATINGS

- ≤ 5.5V power supply

Caution: Do not exceed the conditions listed above, otherwise the board will be damaged.

PROCEDURE

The IS31BL3508A evaluation board is fully assembled and tested. Follow the steps listed below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Connect the Power Supply ground terminal to the PCB GND input pin and the positive terminal to the PCB VCC input pin. Or connect a wall-mount DC power out plug (center power) to the PCB connector (CON1 / DC IN).
- 2) Turn on the power supply and pay attention to the supply current. If the current exceeds 2A, please check for circuit fault.

EVALUATION BOARD OPERATION

The WLED light intensity is adjusted by the onboard MCU (LPC936) which generates a PWM signal to the IS31BL3508A EN pin 4. There are 32 intensity levels with the lowest set as the power on default. Pressing the Level+ key will increase the intensity level while pressing the Level- key will decrease the level. The 7-segment LED (DIG1) will show the corresponding light intensity level. The SD/EN key is used to toggle between shutdown and enable modes. The LED+ and LED- are test points to monitor the output voltage.

LED CURRENT SETTING

When the IS31BL3508A is used for driving LEDs, the LED current flows through the external feedback resistor R1 and R2 to regulate the LED current. The internal feedback regulation point is 0.3V.

The maximum LED current may be calculated by the following Equation:

$$I_{MAX} = V_{FB} / R_{SET} \quad \text{and} \quad R_{SET} = R_1 / R_2, \quad (R_2=1\Omega \text{ if zero ohm resistor used}).$$

For accurate LED current, resistors should be 1% or better tolerance.
