

**FEATURES** 

High Efficiency: 94% @ 12Vin, 5.0V/40A out

30.5\*27.9\*11.1(1.20"\*1.10"\*0.44")

- Wide input range: 4.5V~13.8V
- Output voltage programmable from 0.6Vdc to 5.0Vdc via external resistors
- No minimum load required
- Fixed frequency operation
- Input UVLO, output SCP, OVP.
- Remote On/Off (Positive logic)
- **Power Good Function**
- RoHS 5 / RoHS 6
- ISO 9001, TL 9000, ISO 14001, QS9000, OHSAS18001 certified manufacturing facility

# Delphi D12F200 Non-Isolated Point of Load DC/DC Modules: 4.5V~13.8Vin, 0.6V~5.0Vout, 40A

## **APPLICATIONS**

- Telecom / DataCom
- Distributed power architectures
- Servers and workstations
- LAN / WAN applications
- Data processing applications

# **TECHNICAL SPECIFICATIONS**

(Ambient Temperature=25°C, nominal  $V_{in}$ =12Vdc unless otherwise specified.)

# **DESIGN CONSIDERATIONS**

The D12F200 uses a two phase and voltage mode controlled buck topology. The output can be trimmed in the range of 0.6Vdc to 5.0Vdc by a resistor from Trim pin to Ground.

The converter can be turned ON/OFF by remote control. Positive on/off (ENABLE pin) logic implies that the converter DC output is enabled when the signal is driven high (greater than 1.2V) or floating and disabled when the signal is driven low (below 0.6V).

The converter provides an open collector Power Good signal. The power good signal is pulled low when output is not within ±10% of Vout or Enable is OFF.

For output voltages above 1.8V, please refer to Figure 31 below for minimum input voltage requirement for proper module operations.

The converter can protect itself by entering hiccup mode against over current and short circuit condition.

#### **Safety Considerations**

It is recommended that the user to provide a fuse in the input line for safety. The output voltage set-point and the output current in the application could define the amperage rating of the fuse.

Figure 31: minimum input voltage required for output voltages above 1.8V

# FEATURES DESCRIPTIONS

## Enable (On/Off)

The ENABLE (on/off) input allows external circuitry to put the D12F200 converter into a low power dissipation (sleep) mode. Positive ENABLE is available as standard.

Positive ENABLE units of the D12F200 series are turned on if the ENABLE pin is high or floating. Pulling the pin low will turn off the unit. With the active high function, the output is guaranteed to turn on if the ENABLE pin is driven above 1.2V. The output will turn off if the ENABLE pin voltage is pulled below 0.6V.

## Input Under-Voltage Lockout

The input under-voltage lockout prevents the converter from being damaged while operating when the input voltage is too low. The under-voltage lockout is adjustable by adding a resistor (Figure 32) between Enable pin and ground pin per the following equation:

$$\operatorname{Re} n(K\Omega) = \frac{315}{14Ven + 3.8}$$

Default lockout range is between 4.3V and 4.0V.

Figure 32: Enable input drive circuit example.

# Reflected Ripple Current and Output Ripple and Noise Measurement

The measurement set-up outlined in Figure 33 has been used for both input reflected/ terminal ripple current and output voltage ripple and noise measurements on D12F200 converters.

Figure 33: Input reflected ripple/ capacitor ripple current and output voltage ripple and noise measurement setup for D12F200

# FEATURES DESCRIPTIONS (CON.)

#### **Over-Current and Short-Circuit Protection**

The D12F200 modules have non-latching over-current and short-circuit protection circuitry. When over current condition occurs, the module goes into the non-latching hiccup mode. When the over-current condition is removed, the module will resume normal operation.

An over current condition is detected by measuring the voltage drop across the inductor. The voltage drop across the inductor is also a function of the inductor's DCR.

Note that none of the module specifications are guaranteed when the unit is operated in an over-current condition.

#### **Output Over Voltage Protection (OVP)**

The converter will shut down when an output over voltage protection is detected. Once the OVP condition is detected, controller will stop all PWM outputs and turn on low-side MOSFET to prevent any damage to load.

#### **Remote Sense**

The D12F200 provide Vo remote sensing to achieve proper regulation at the load points and reduce effects of distribution losses on output line. In the event of an open remote sense line, the module shall maintain local sense regulation through an internal resistor. The module shall correct for a total of 0.5V of loss. The remote sense connects as shown in Figure 34.

Figure 34: Circuit configuration for remote sense

#### **Output Capacitance**

There are internal output capacitors on the D12F200 modules. Hence, no external output capacitor is required for stable operation.

#### **Output Voltage Programming**

The output voltage of the D12F200 is trimmable by connecting an external resistor between the trim pin and output ground as shown Figure 35 and the typical trim resistor values are shown in Table 1.

Figure 35: Trimming Output Voltage

The D12F200 module has a trim range of 0.6V to 5.0V. The trim resistor equation for the D12F200 is:

$$Rtrim(\Omega) = \frac{1200}{Vout - 0.6}$$

Vout is the output voltage setpoint Rtrim is the resistance between Trim and Ground Rtrim values should not be less than  $270\Omega$ 

Output	Rtrim (Ω)		
0.6V	open		
+0.9 V	4K		
+1.2V	2K		
+1.5 V	1.33K		
+1.8V	1K		
+2.5 V	631.6		
+3.3 V	444.4		
+5.0V	272.7		

Table 1: Typical trim resistor values

## **Power Good**

The converter provides an open collector signal called Power Good. This output pin uses positive logic and is open collector. This power good output is able to sink 4mA and set high when the output is within  $\pm 10\%$  of output set point. The power good signal is pulled low when output is not within  $\pm 10\%$  of Vout or Enable is OFF.

#### **Paralleling**

D12F200 converters do not have built-in current sharing (paralleling) ability. Hence, paralleling of multiple D12F200 converters is not recommended.

# THERMAL CONSIDERATION

Thermal management is an important part of the system design. To ensure proper, reliable operation, sufficient cooling of the power module is needed over the entire temperature range of the module. Convection cooling is usually the dominant mode of heat transfer.

Hence, the choice of equipment to characterize the thermal performance of the power module is a wind tunnel.

## **Thermal Testing Setup**

Delta's DC/DC power modules are characterized in heated vertical wind tunnels that simulate the thermal environments encountered in most electronics equipment. This type of equipment commonly uses vertically mounted circuit cards in cabinet racks in which the power modules are mounted.

The following figure shows the wind tunnel characterization setup. The power module is mounted on a test PWB and is vertically positioned within the wind tunnel. The space between the neighboring PWB and the top of the power module is constantly kept at 6.35mm (0.25").

#### **Thermal Derating**

Heat can be removed by increasing airflow over the module. To enhance system reliability, the power module should always be operated below the maximum operating temperature. If the temperature exceeds the maximum module temperature, reliability of the unit may be affected.

**Note:** Wind tunnel test setup figure dimensions are in millimeters and (Inches)

Figure 36: Wind tunnel test setup
