The applicable maximum current is the absolute value.

For example, -1mA means the maximum current 1mA flows out the LSI through the pin.

Stresses above the absolute maximum ratings listed in the above table may cause permanent damage to the device.

These are stress ratings only and functional operation of the device at these conditions is not implied.

Thermal characteristics

The maximum chip-junction temperature, T_{jmax} , may be calculated using the following equation.

$$T_{jmax} = T_{amax} + P_{Dmax} \times \theta_{ja}$$

T_{amax} : maximum ambient temperature

P_{Dmax} : LSI maximum power dissipation

θ_{ja} : Package junction to ambient thermal resistance

Design a Mounting board by considering heat radiation such as power dissipation and ambient temperature to satisfy the recommended conditions.

The following table shows the each package's thermal resistance for thermal design reference estimated by simulation based on the PCB (printed circuit board) conditions define as a below.

^{*1} Sink-out current from V_{DD} to the output pin, which can guarantee the device operation.

^{*2} Sink-in current from the output pin to V_{SS}, which can guarantee the device operation.

^{*3} Do not exceed total current.

^{*4} The total current is on the condition of Duty≤50%(same applies to IOH1).

When the duty>50% the total current is calculated by following formula.

Total current = IOL3 x 50/n (When the duty is n%)

<For an example> When IOL3=100mA and n=80%,

Total current = IOL3 x 50/80 = 62.5mA

Current allowed per 1pin is independent of the duty and specified as IOL1 and IOL2.

Do not apply current larger than Absolute Maximum Ratings.

^{*5} The current flowing out the LSI through the pin is described in the negative number.

The applicable maximum current is the absolute value.

For example, -1mA means the maximum current 1mA flows out the LSI through the pin.

^{*6} These values are satisfied with VOH1, VOL1 and VOL2.
