# **RENESAS** 2-Output 1.8V PCIe Zero-Delay/Fanout Clock Buffer with Zo = 330hms

### DATASHEET

### Description

The 9DBV0231 is a member of Renesas' 1.8V Very-Low-Power (VLP) PCIe family. The device has 2 output enables for clock management.

### **Recommended Application**

1.8V PCIe Gen1–5 Zero-Delay/Fan-out Buffer (ZDB/FOB)

### **Output Features**

• Two 1–200MHz Low-Power (LP) HCSL DIF pairs

### **Key Specifications**

- DIF cycle-to-cycle jitter < 50ps
- DIF output-to-output skew < 50ps
- PCIe Gen5 CC additive phase jitter < 40fs RMS</li>
- 12kHz–20MHz additive phase jitter = 156fs RMS at 156.25MHz (typical)

### Features/Benefits

- LP-HCSL outputs; save 4 resistors compared to standard HCSL outputs
- 35mW typical power consumption in PLL mode; reduced thermal concerns
- Spread Spectrum (SS) compatible; allows use of SS for EMI reduction
- OE# pins; support DIF power management
- HCSL compatible differential input; can be driven by common clock sources
- SMBus-selectable features; optimize signal integrity to application
  - Slew rate for each output
  - Differential output amplitude
- Pin/software selectable PLL bandwidth and PLL Bypass; minimize phase jitter for each application
- Outputs blocked until PLL is locked; clean system start-up
- Device contains default configuration; SMBus interface not required for device control
- 3.3V tolerant SMBus interface works with legacy controllers
- Space saving 4 × 4mm 24-VFQFPN; minimal board space

### **Pin Configuration**

24-pin VFQFPN, 4x4 mm, 0.5mm pitch ^ prefix indicates internal 120KOhm pull up resistor ^v prefix indicates internal 120KOhm pull up AND pull down resistor (biased to VDD/2) v prefix indicates internal 120KOhm pull down resistor

#### **Power Management Table**

CKPWRGD PD#	CLK IN	SMBus		DIF	PLL	
		OEx bit	OEx# Pin	True O/P	Comp. O/P	FLL
0	Х	Х	Х	Low	Low	Off
1	Running	0	Х	Low	Low	On <sup>1</sup>
1	Running	1	0	Running	Running	On <sup>1</sup>
1	Running	1	1	Low	Low	On <sup>1</sup>

1. If Bypass mode is selected, the PLL will be off, and outputs will be running.

#### **SMBus Address Table**

Address	+ Read/Write bit
1101101	х

#### **Power Connections**

Pin Numb	er	Description		
VDD	GND	Description		
2	5	Input receiver analog		
7	6	Digital Power		
11,20	10,21	DIF outputs		
16	15	PLL Analog		

#### **Frequency Select Table**

### **Test Loads**

L = 5 inches

#### **Differential Output Terminations**

Rs	Zo	Units
33	100	Ohms
27	85	Onins

### **Alternate Terminations**

The 9DBV family can easily drive LVPECL, LVDS, and CML logic. See <u>"AN-891 Driving LVPECL, LVDS, and CML Logic with</u> <u>"Universal" Low-Power HCSL Outputs</u>" for details.

### **Absolute Maximum Ratings**

Stresses above the ratings listed below can cause permanent damage to the 9DBV0231. These ratings, which are standard values for Renesas commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
1.8V Supply Voltage	VDDxx	Applies to all VDD pins	-0.5		2.5	V	1,2
Input Voltage	V <sub>IN</sub>		-0.5		$V_{DD}$ +0.5V	V	1, 3
Input High Voltage, SMBus	VIHSMB	SMBus clock and data pins			3.6V	V	1
Storage Temperature	Ts		-65		150	°C	1
Junction Temperature	Tj				125	°C	1
Input ESD protection	ESD prot	Human Body Model	2000			V	1

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Operation under these conditions is neither implied nor guaranteed.

<sup>3</sup> Not to exceed 2.5V.

### **Electrical Characteristics–Clock Input Parameters**

TA = T<sub>AMB</sub>, Supply Voltages per normal operation conditions, See Test Loads for Loading Conditions

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES

SCLK/SDATA Fall Time	t <sub>FSMB</sub>	(Min VIH + 0.15) to (Max VIL - 0.15)			300	ns	1
SMBus Operating	f <sub>MAXSMB</sub>	Maximum SMBus operating frequency			400		6

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

 $^2\mbox{Control}$  input must be monotonic from 20% to 80% of input swing.

 $^3$  Time from deassertion until outputs are >200 mV.

 $^4$  For V<sub>DDSMB</sub> < 3.3V, V<sub>IHSMB</sub> >= 0.8xV<sub>DDSMB</sub>.

<sup>5</sup> DIF\_IN input.

<sup>6</sup> The differential input clock must be running for the SMBus to be active.

### **Electrical Characteristics–DIF 0.7V Low Power HCSL Outputs**

	Valtages per perma	I anaration conditions	See Test Le	ada far Laading Canditiona
$IA = I_{AMB}$ Supply	voltages per norma	i operation conditions,	See lest Loa	ads for Loading Conditions

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
Slew rate	dV/dt	Scope averaging on, fast setting	1.9	3.2	4	V/ns	1,2,3
Slew late	dV/dt	Scope averaging on, slow setting	1.4	2.3	3.3	V/ns	1,2,3
Slew rate matching	: dV/dt	Slew rate matching, Scope averaging on		5	20	%	1,2,4
Voltage High	V <sub>HIGH</sub>	Statistical measurement on single-ended signal using oscilloscope math function. (Scope	660	779	850	mV	7
Voltage Low	V <sub>LOW</sub>	averaging on)		21	150	111 V	7
Max Voltage	Vmax	Measurement on single ended signal using		835	1150	mV	7
Min Voltage	Vmin	absolute value. (Scope averaging off)	-300	-42		IIIV	7
Crossing Voltage (abs)	Vcross_abs	Scope averaging off	250	409	550	mV	1,5
Crossing Voltage (var)	∆-Vcross	Scope averaging off		14	140	mV	1,6

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross\_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ-Vcross to be smaller than Vcross absolute.

<sup>7</sup> At default SMBus settings.

### **Electrical Characteristics–Current Consumption**

Skew, Output to Output	t <sub>sk3</sub>	V <sub>T</sub> = 50%		33	50	ps	1,4
Jitter, Cycle to cycle	+.	PLL mode		13	50	ps	1,2
	t <sub>jcyc-cyc</sub>	Additive Jitter in Bypass Mode		0.1	5	ps	1,2

<sup>1</sup> Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

<sup>4</sup> All outputs at default slew rate

<sup>5</sup> The MIN/TYP/MAX values of each BW setting track each other, i.e., Low BW MAX will never occur with Hi BW MIN.

### Electrical Characteristics–Phase Jitter Parameters – 12kHz to 20MHz

T<sub>AMB</sub> = over the specified operating range. Supply Voltages per normal operation conditions. See Test Loads for loading conditions.

Parameter	Symbol	Conditions	Minimum	Typical	Maximum	Specification Limit	Units	Notes
12k-20M Additive Phase Jitter,	t	Fan-out Buffer Mode,		156		n/a	ß	1 2 3
Fan-out Buffer Mode	₿ph12k-20MFOB	SSC OFF, 156.25M Hz		100		Π/a	(rms)	1, 2, 3

Notes:

1. Applies to all differential outputs, guaranteed by design and characterization. See Test Loads for measurement setup details.

2. 12kHz to 20M Hz brick wall filter.

3. For RMS values additive jitter is calculated by solving for b where  $[b = sqrt(c^2 - a^2)]$ , a is rms input jitter and c is rms total jitter.

## Electrical Characteristics–Additive PCIe Phase Jitter for Fanout Buffer Mode<sup>[7]</sup>

T<sub>AMB</sub> = over the specified operating range. Supply Voltages per normal operation conditions. See Test Loads for loading conditions.

Notes:

1. The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 5.0, Revision 1.0. See the Test Loads section of the data sheet for the exact measurement setup. The total Ref Clk jitter limits for each data rate are listed for convenience. The worst case results for each data rate are summarized in this table. If oscilloscope data is used, equipment noise is removed from all results.

2. Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20 GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately - Jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200 MHz (at 300 MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5 GT/s data rate, the RMS jitter is converted to peak to peak jitter using a multiplication factor of 8.83. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results the RTO result must be used.

3. SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2 MHz taking care to minimize removal of any non-SSC content.

4. Note that 0.7 ps RMS is to be used in channel simulations to account for additional noise in a real system.

5. Note that 0.25 ps RMS is to be used in channel simulations to account for additional noise in a real system.

6. The PCI Express Base Specification 5.0, Revision 1.0 provides the filters necessary to calculate SRIS jitter values, however, it does not provide specification limits, hence the n/a in the Limit column. SRIS values are informative only. In general, a clock operating in an SRIS system must be twice as good as a clock operating in a Common Clock system. For RMS values, twice as good is equivalent to dividing the CC value by  $\sqrt{2}$ . And additional consideration is the value for which to divide by  $\sqrt{2}$ . The conservative approach is to divide the ref clock jitter limit, and the case can be made for dividing the channel simulation values by  $\sqrt{2}$ , if the ref clock is close to the Tx clock input. An example for Gen4 is as follows. A "rule-of-thumb" SRIS limit would be either 0.5ps RMS/ $\sqrt{2}$  = 0.35ps RMS if the clock chip is far from the clock input, or 0.7ps RMS/ $\sqrt{2}$  = 0.5ps RMS if the clock chip is near the clock input.

7. Additive jitter for RMS values is calculated by solving for b where  $b = \sqrt{(c^2 - a^2)}$ , and a is rms input jitter and c is rms output jitter.

### Additive Phase Jitter Plot: 125M (12kHz to 20MHz)

### **General SMBus Serial Interface Information**

#### How to Write

- Controller (host) sends a start bit
- Controller (host) sends the write address
- Renesas clock will acknowledge
- Controller (host) sends the beginning byte location = N
- Renesas clock will **acknowledge**
- Controller (host) sends the byte count = X
- Renesas clock will **acknowledge**
- Controller (host) starts sending Byte N through Byte N+X-1
- Renesas clock will acknowledge each byte one at a time
- Controller (host) sends a Stop bit

	Index Blo	ock V	Vrite Operation
Controlle	er (Host)		Renesas (Slave/Receiver)

Note: SMBus Address is 1101101x, where x is the read/write bit.

#### How to Read

- Controller (host) will send a start bit
- Controller (host) sends the write address
- Renesas clock will acknowledge
- Controller (host) sends the beginning byte location = N
- Renesas clock will acknowledge
- Controller (host) will send a separate start bit
- · Controller (host) sends the read address
- Renesas clock will acknowledge
- Renesas clock will send the data byte count = X
- Renesas clock sends Byte N+X-1
- Renesas clock sends Byte 0 through Byte X (if X<sub>(H)</sub> was written to Byte 8)
- · Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

### **Marking Diagrams**

Notes:

- 1. "LOT" is the lot sequence number.
- 2. YYWW is the last two digits of the year and week that the part was assembled.
- 3. Line 2: truncated part number
- 4. "L" denotes RoHS compliant package.
- 5. "I" denotes industrial temperature range device.

### **Thermal Characteristics**

PARAMETER	SYMBOL	CONDITIONS	PKG	TYP VALUE	UNITS	NOTES

### Package Outline Drawings

The package outline drawings are located at the end of this document and are accessible from the Renesas website. The package information is the most current data available and is subject to change without revision of this document.

#### 24-VFQFPN (NLG24P1)

### **Ordering Information**

Part / Order Number	Shipping Packaging	Package	Temperature	
9DBV0231AKLF	Tubes	24-pin VFQFPN	0 to +70° C	
9DBV0231AKLFT	Tape and Reel	24-pin VFQFPN	0 to +70° C	
9DBV0231AKILF	Tubes	24-pin VFQFPN	-40 to +85° C	
9DBV0231AKILFT	Tape and Reel	24-pin VFQFPN	-40 to +85° C	

"LF" suffix to the part number are the Pb-Free configuration and are RoHS compliant.

"A" is the device revision designator (will not correlate with the datasheet revision).

### **Revision History**

Revision Date	Description
August 13, 2012	1. Updated electrical characteristics tables.
7109031 10, 2012	2. Move to final.
	1. Changed VIH min. from 0.65*VDD to 0.75*VDD
	2. Changed VIL max. from 0.35*VDD to 0.25*VDD
	<ol><li>Added missing mid-level input voltage spec (VIM) of 0.4*VDD to 0.6*VDD.</li></ol>
	4. Changed Shipping Packaging from "Trays" to "Tubes".
	5. Reformatted to new template
	1. Updated block diagram with new format showing individual outputs instead of bussed outputs.
	<ol><li>Updated pin out and pin descriptions to show ePad on package connected to ground.</li></ol>
April 3, 2015	3. Updated front page text to standard format for these devices. Added explicit bullet indicated Spread Spectrum
	compatibilty. Changed data sheet title, etc.
	4. Added additive phase jitter plot and updated phase jitter spec table.
	1. Replaced "Driving LVDS" with "Alternate Terminations", adding reference to AN-891.
August 10, 2015	2. Updated "Clock Input Parameters Table" correcting inconsistency with PCIe SIG specifications.
7 luguot 10, 2010	<ol><li>Widened allowable input frequency at each PLL mode frequency.</li></ol>
	4. Updated NLG24 package drawing with actual package info instead of generic drawing.
	1. Minor typographical corrections throughout the data sheet
	2. Updated test load diagram to generic diagram. Length of test load listed outside the drawing.
	3. Minor updates to electrical tables for formatting. Removed Schmitt trigger info and output high/low voltage
	specifications for single-ended outputs, since this part does not have any.
	4. "Low-Power HCSL Outputs" table: corrected inversion of slew rate setting with specifications. Changed reference
November 5, 2015	from 2 V/ns and 3 V/ns to slow setting and fast setting. Also change references in SMBus Bytes[3:2]
	5. "Low-Power HCSL Outputs" table: Removed Vswing parameter since this is an input parameter and is covered in
	"Clock Input Parameters" Table.
	6. Reduced current consumption limits.
	7. Minor updates to other electrical tables.
	1. Updated max frequency of 100MHz PLL mode to 140MHz
April 28, 2016	2. Updated max frequency of 125MHz PLL mode to 175MHz
7,011 20, 2010	3. Updated max frequency of 50MHz PLL mode to 65MHz
	1. Updated document title.
	2. Updated Recommended Applications.
July 30, 2021	3. Updated Key Specifications.
	4. Updated Package Outline Drawings section.
	5. Updated Phase Jitter tables.
