

Overview

Rigado's BMD-200 is a powerful, highly flexible Bluetooth low energy module based on the nRF51822 SoC from Nordic Semiconductor. With an ARM® Cortex™ M0 CPU, embedded 2.4GHz transceiver, and on-module chip antenna, the BMD-200 provides a complete RF solution with no additional RF design, allowing faster time-to-market.

The BMD-200 provides full use of the nRF51822's on-chip peripherals, allowing for a wide range of applications without the need for an external host microcontroller; simplifying designs and reducing BOM costs. With an internal DC-DC converter and a voltage supply range of 1.8V to 3.6V, the BMD-200 can be powered directly from a coin cell or two alkaline with ultra-low power consumption.

SoftDevices

The BMD-200 fully supports Nordic Semiconductor RF protocol stacks known as SoftDevices. They integrate a Bluetooth low energy controller and host, and provide a full and flexible API for building Bluetooth low energy System on Chip (SoC) solutions.

Secure Bootloader

Encrypted Over-The-Air (OTA) and UART firmware updates add a layer of security to your application. The BMD-200 bootloader uses AES-128 encryption allowing for secure updates of your application firmware, bootloader, and SoftDevice.

BMDware

The BMD-200 comes standard with BMDware, providing iBeacon and UART Bridge functions without needing to program the module. Fully configurable over BLE and the UART for end-user or factory provisioning. Direct Test Mode (DTM) via UART is enabled to allow production Bluetooth RF testing with no configuration.
